Additional comment from INFORSE-Europe to working document on possible Ecodesign regulation of directional lighting.

Following the Consultation Forum July 5, INFORSE-Europe would like to propose that the information on lamps that it is proposes to be available on free access websites is also submitted to a designated authority in each EU country where the lamp is sold. Then the designated authority shall make this information available for energy efficiency information services, public information services as well as NGO-driven services and others. This will make it simple to establish websites where consumers can compare light sources. Without this, it will be substantially more difficult to compare the information to be found on the websites of the diferent suppliers. The information service providers should the agree to a fair and unbiased use of the information, not favouring some suppliers above others in the information they make available on their websites, leaflets etc.
