# Sufficiency in transport policy

---

An analysis of EU countries' national energy and climate plans and long-term strategies

# WHY SUFFICIENCY?

- Transport sector policies did not contribute to GHG emission reduction in the past
- Different policies – apart from technical solutions – needed to reach GHG targets!?
- Our definition of sufficiency:

„Energy sufficiency is the **strategy** of achieving **absolute reductions** of the amount of energy-based services consumed, notably through promoting **intrinsically low-energy activities**, to reach a level of “enoughness” that ensures sustainability.“

# EU REPORTS ON CLIMATE AMBITION

- National Energy and Climate Plans (NECPs – target year 2030)
  - 27 plans analysed
  - Chapter structure defined in Governance Regulation
- Long-term Strategies (LTSs – target year 2050)
  - 15 LTSs analysed (cut-off date October 2020)
  - No specified structure

# METHODS

- 6 researchers
- 2 for each report, inter-coder validity
- Key terms, key chapters and more
- Discussion on found measures, consolidation

# CATEGORISATION

- Sector (and cross-sectoral)
- Sufficiency type / policy target
  - Reduction of km
  - Modal shift
  - General supporting
- Instrument type (UNFCCC 2000)

# TRANSPORT SUFFICIENCY

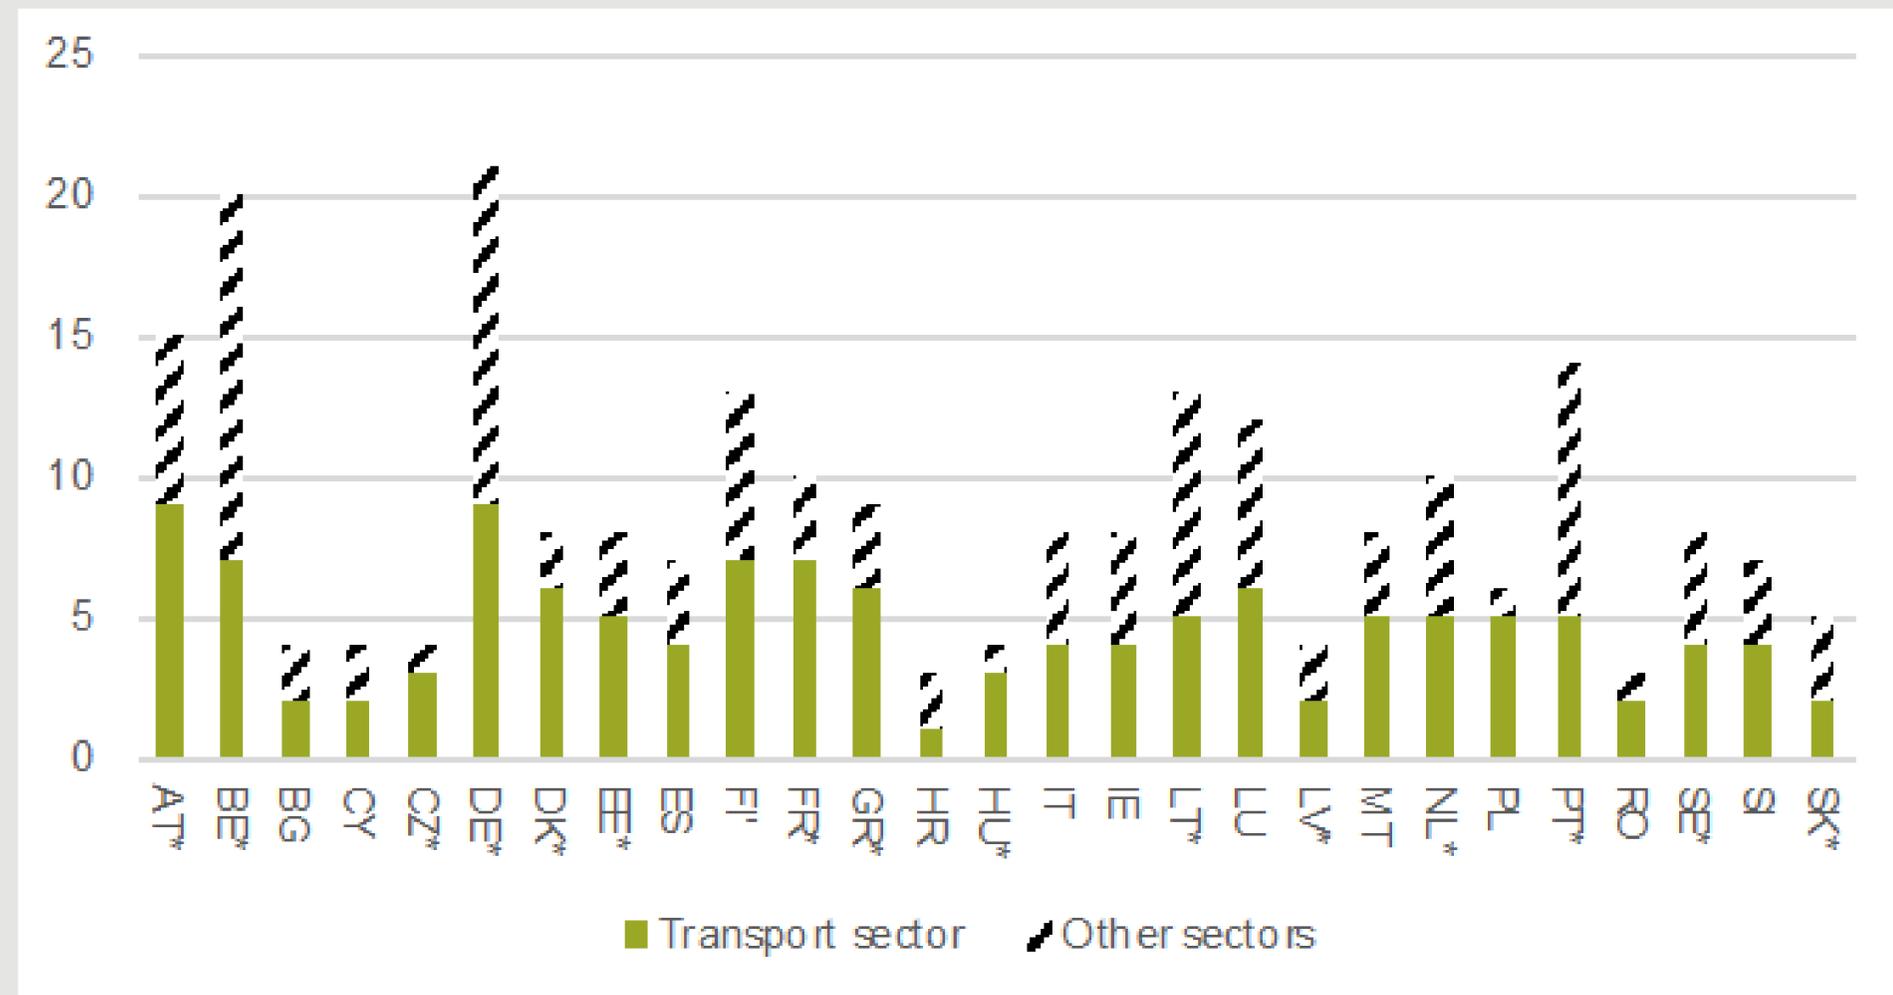

Avoid	Shift	Improve
<b>Sufficiency</b>	Fuel/tech swich = Consistency or Efficiency	Efficiency
	Mode shift = <b>Sufficiency</b> (substitution)	

- Teleworking / city planning
- Public transport / cycling + walking

# RESULTS - # OF MEASURES

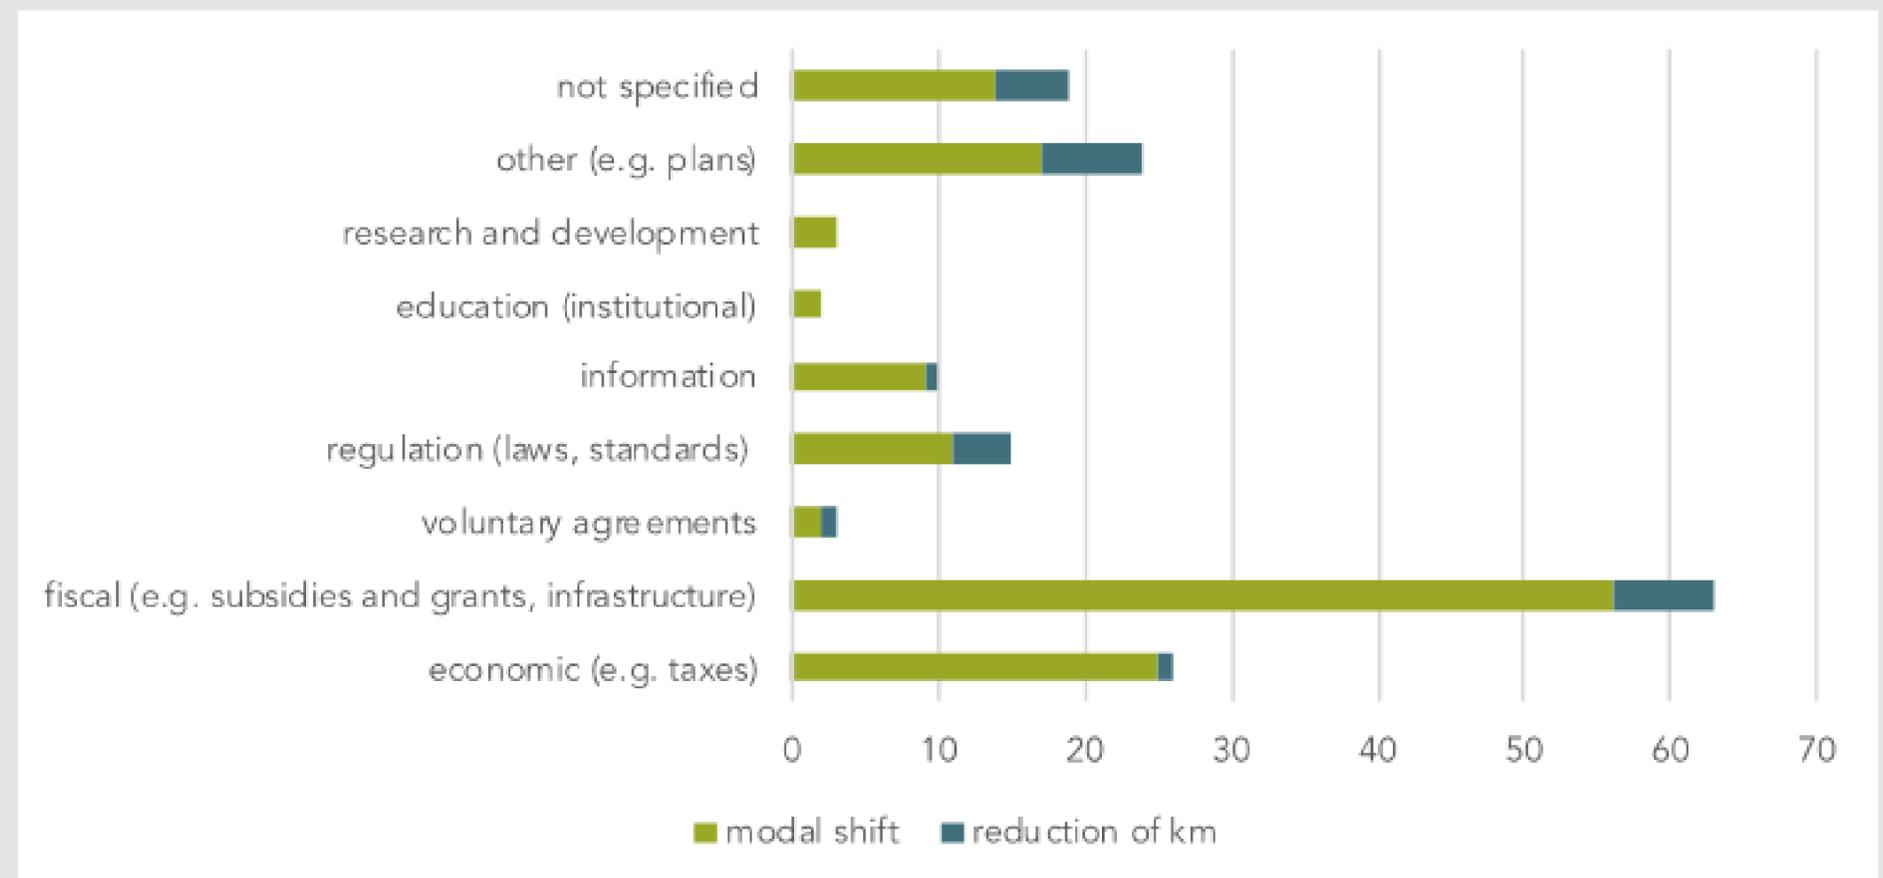

- 236 in all sectors, 124 in transport (53 %) and 41 cross-sectoral
- By country:

# RESULTS – SUFFICIENCY & INSTRUMENT TYPES

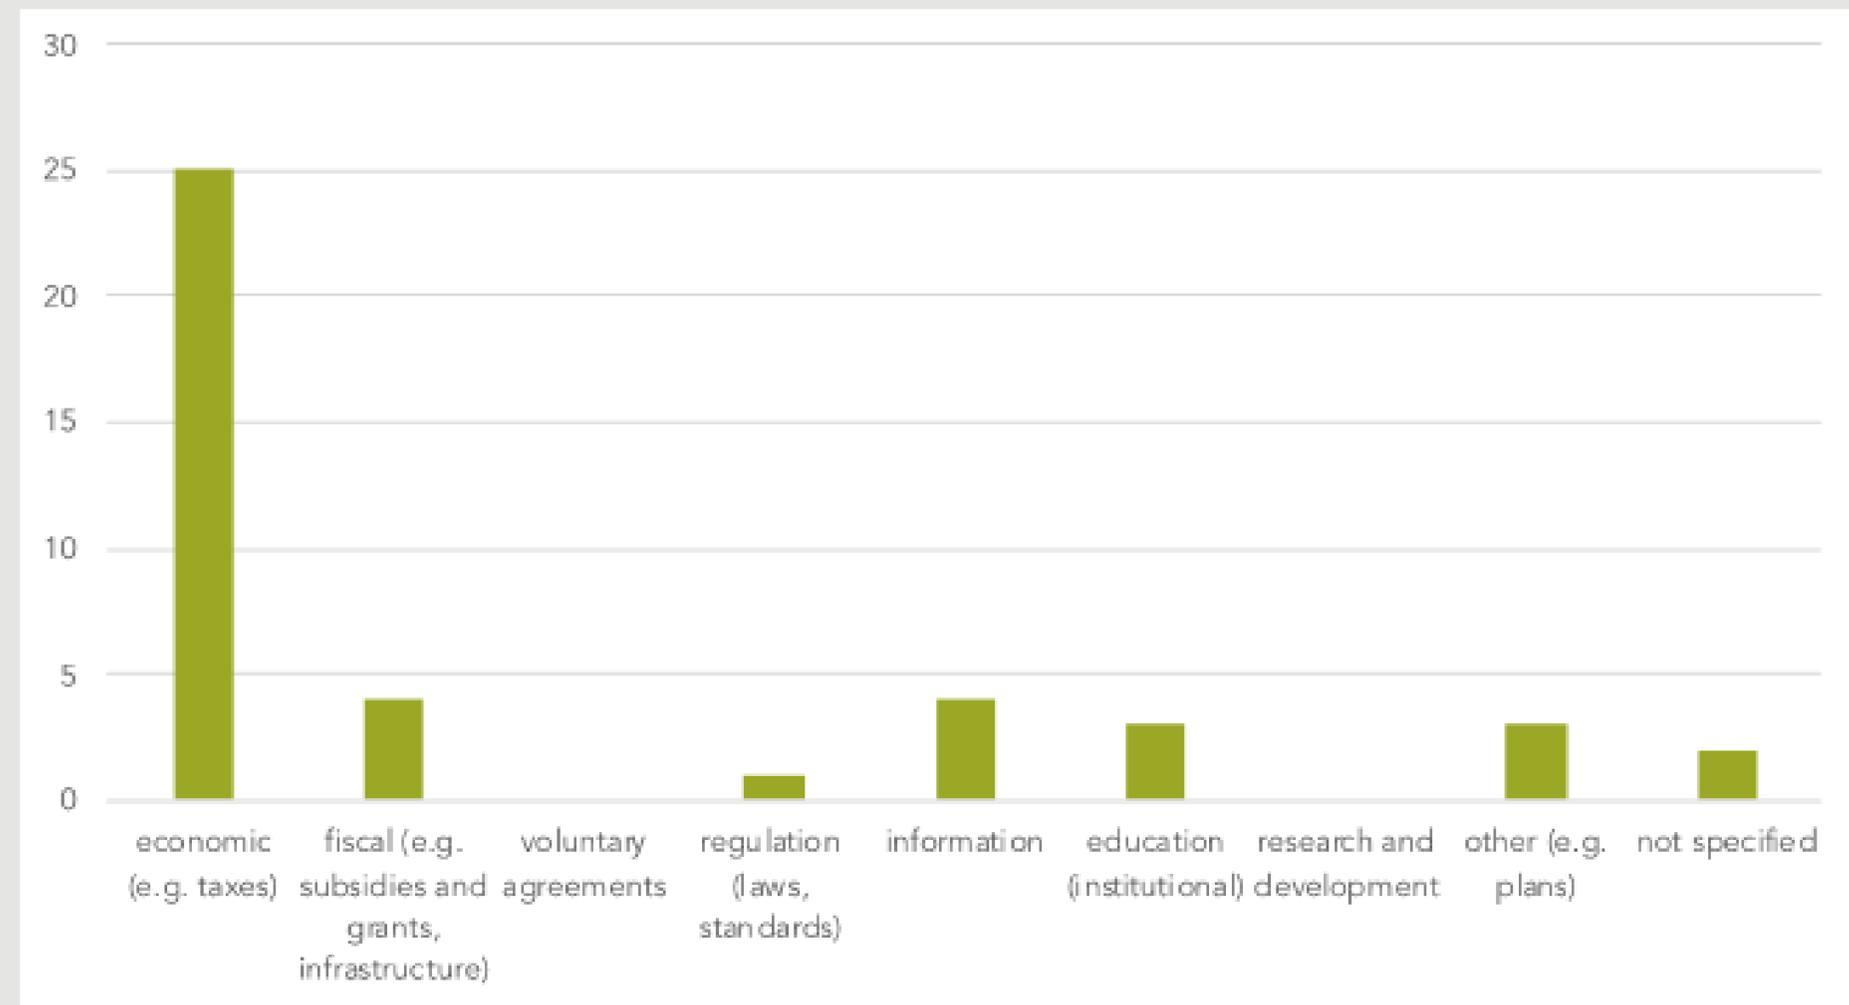

- Majority (82 %) aim at modal shift
- Fiscal and economic instruments dominate – infrastructure!

# RESULTS – GENERAL SUPPORTING MEASURES

- From 41 cross-sectoral measures 25 use economic instruments (mainly carbon taxation or emission-driven tax reforms)

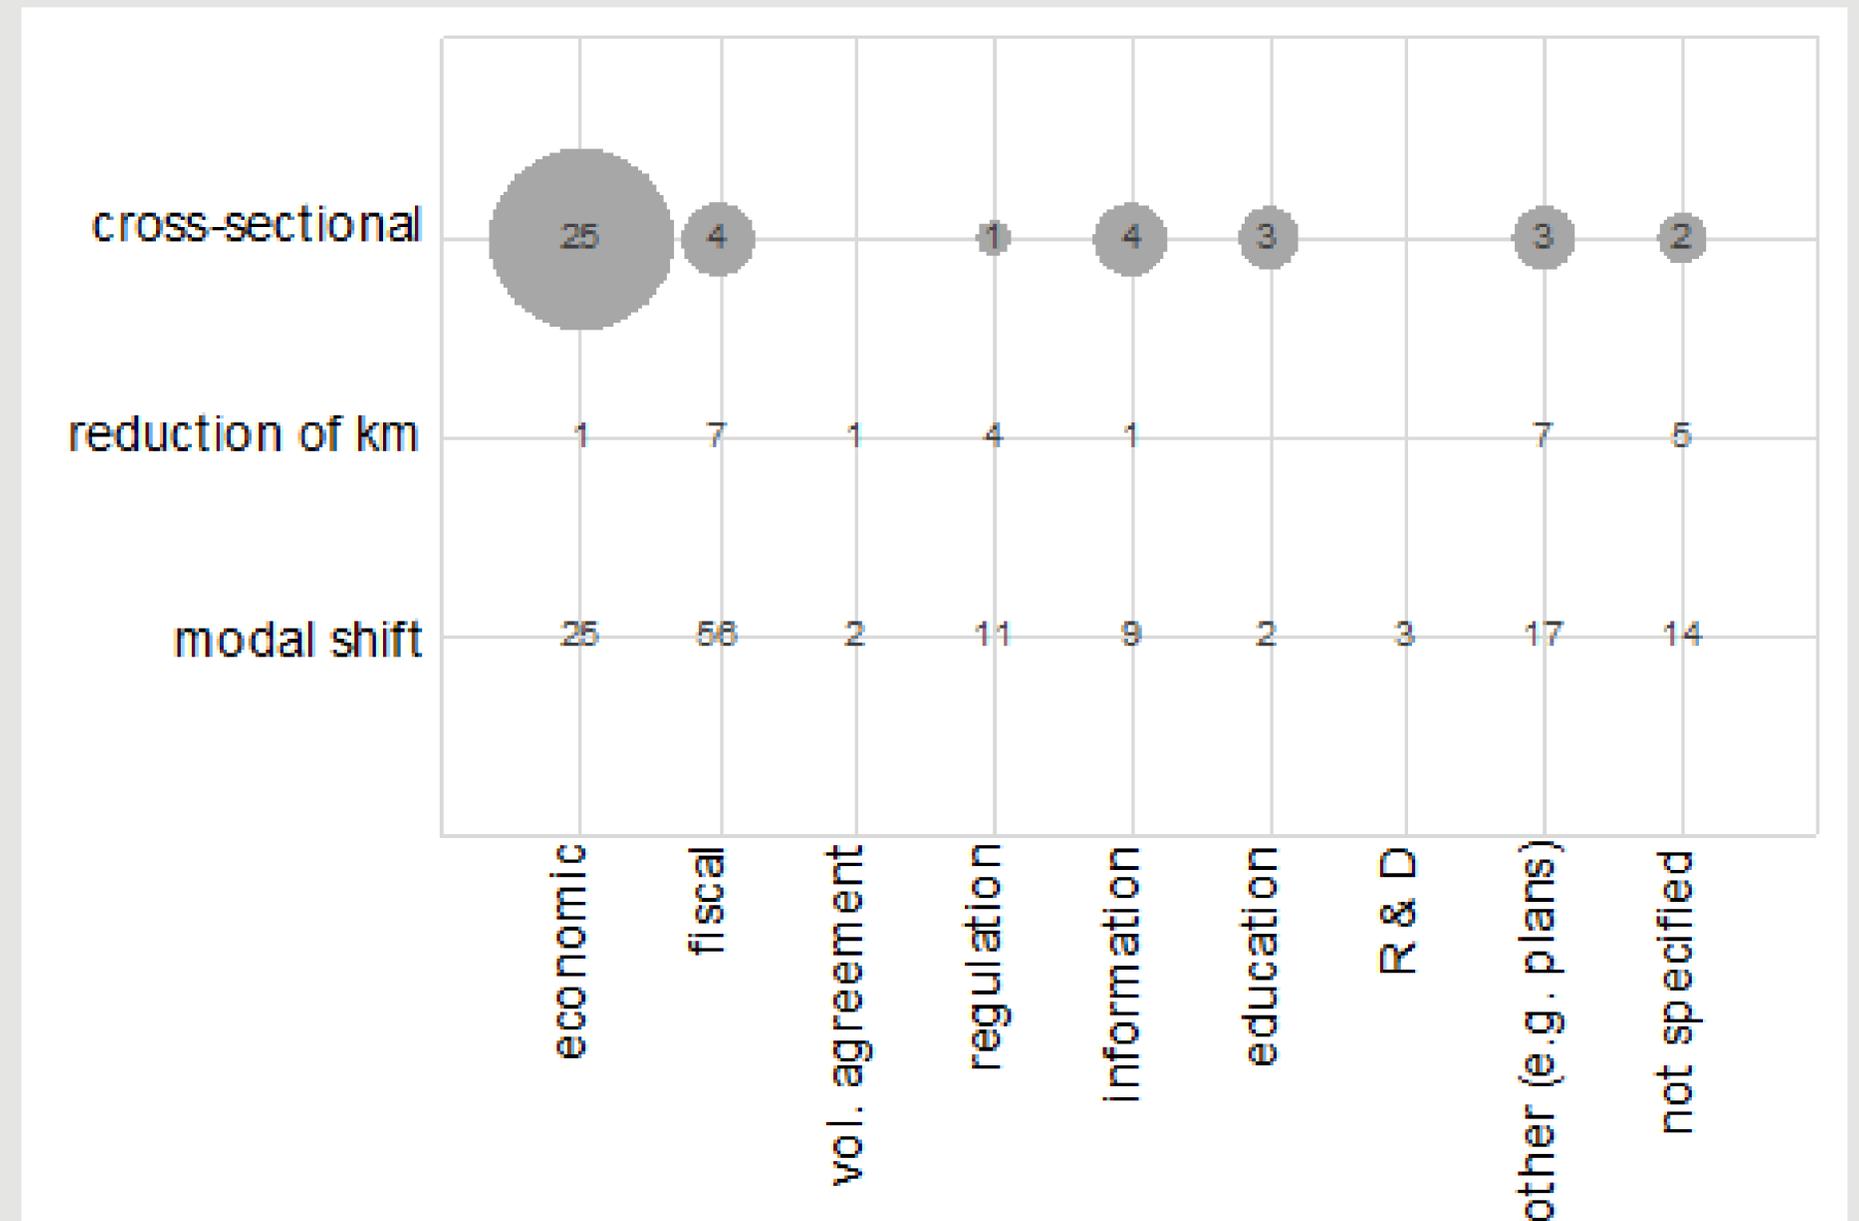

## MORE RESULTS

- Much more measures to make modal shift and less travel **attractive (pull)**, few measures to make other forms of transport **unattractive (push)** (e.g. reducing parking lots)
- Few **freight** measures (18 from 124) and no one aiming at reduction

# RESULTS - OVERVIEW

- Barely measures on reduction of km
- Instrument type **regulation** not much intended to use

# DISCUSSION AND CONCLUSIONS

- NECP measures will lead to **GHG reduction of 41 % (EU) by 2030** which is not sufficient for the revised target of **-55 %**
- Direct comparison of efficiency, consistency and sufficiency would be good
- NECP / LTS structure: include a chapter on sufficiency

# DISCUSSION AND CONCLUSIONS

- We need stringent governance to reach targets and to transform the transport sector. **Ideas:**
  - obligation to localities to ensure public transport anywhere with a certain frequency (e.g. half-hourly)
  - car size/weight standards and/or absolute consumption limits
  - stricter speed limits
  - city access restrictions
  - fossil fuel phase-outs

*THANK YOU!*

# ACKNOWLEDGEMENTS

We want to thank Jonas Lage and Annika Schmidt for their contribution to the NECP / LTS sufficiency analysis.

This research has been conducted within the junior research group energy sufficiency, funded by the German Federal Ministry of Education and Research within the Research for Sustainable Development Program [grant number 01UU2004].
