

# Defining features of the technological innovation system for zero emission buildings

Hilde Nykamp

# **Today**

First, say a little about plans for my thesis

 I will present some preliminary observations about the possibilities for environmental innovation in the construction industry

# **Background**

- Disconnect the know-how is there but uptake in the industry is slow
- Some very good and ambitious demonstration-projects have been built

 Why? Are there special features in construction that's holding back the use of relevant knowledge

### Three directions of research

1) State of TIS – functional analysis

- 2) Micro-level study of planning/design process – integration and learning between disciplines
- 3) Transitions oriented study sustainable buildings role and relation to other industries, like energy and mobility

UiO Centre for Technology, Innovation and Culture University of Oslo

From: Bergek et al. 2008

# **Defining the TIS in focus**

- "Sustainable buildings" collective term for many different building concepts (Passive house, active house, zero emission building, plus energy building, BREEAM, LEED etc.)
- The general idea is consume little or no energy or compensate for energy use by producing heat and or electricity

# **Defining the TIS in focus**

- Buildings are not one technology but a product with a bundle of integrated technologies
- Architectural innovation (Henderson & Clarke 1995)

 Complex product systems (Miller et.al 1995, Winch 1998)

# **Defining characteristics (product)**

## **Complex systems product**

- Engineering intensive
- Highly customized
- Relatively unique one off product
- Long lasting (50+ years)
- Costly
- Place bound

## Structural components

#### **Actors**

 Firms along value chain, design organization and production organization, industry level organizations, knowledge/educational actors

#### **Institutions**

Regulative, normative, cognitive

#### **Networks**

Relationships – formal networks

# **Defining characteristics (Process)**

- Competitive tendering
- Extensive use of subcontracting
- Project based
  - Two overlapping organizations
  - Discontinuous /temporary
  - Multidisciplinary
- Complexity (uncertainty, unknown dependencies and lack of information)

UiO Centre for Technology, Innovation and Culture University of Oslo

## Thank you!
